SkyTel Troubleshooting Guide

Step-by-step fixes for common network and data problems

Quick reference

Problem	First thing to try	Contact support if
Slow internet	Toggle airplane mode and restart the phone	Still slow and the daily allowance is not used up
No signal	Restart the phone and re-seat the SIM	No signal in several places
APN or data settings	Select the SkyTel internet APN	Settings do not save
VoLTE not working	Enable VoLTE in network settings	Option is missing on a compatible phone
Calls not connecting	Check balance and plan validity	Account is active and calls still fail
SMS not received	Check signal and message storage	Other people can receive SMS

Slow internet

1. Toggle airplane mode on for ten seconds, then off.
2. Restart the phone.
3. Check whether the daily high-speed data allowance is exhausted. After it is used, speed is reduced until midnight.
4. Move to a spot with better coverage, such as near a window or outdoors.
5. If the problem continues, contact SkyTel support.

No signal

1. Restart the phone and re-seat the SIM: switch off, remove the SIM, clean it gently, reinsert and switch on.
2. Check local coverage. A building, basement or remote area can have weak signal.
3. Check that the account is active and the plan has not expired.
4. Try the SIM in another phone to find out whether the phone or the SIM is the cause.
5. If the issue continues, contact SkyTel support.

APN setup

Open your device's mobile network settings and select the SkyTel internet APN. If the APN is not listed, contact SkyTel support for the current settings. After saving, restart the phone and test mobile data.

VoLTE

Enable VoLTE in mobile network settings when it is supported by the device and local coverage. VoLTE gives clearer calls and lets you use data during a call. If the option is missing, check that your phone software is up to date.

Calls not connecting

1. Check that your plan is active and your balance is enough for the call.
2. Make sure airplane mode is off and the signal bars are visible.
3. Restart the phone and try again.
4. Try calling a different number to rule out a problem with the other person's phone.

SMS not received

- Check that your signal is stable and the phone's message storage is not full.
- Some bank and app OTPs can be delayed during network congestion; wait two minutes before requesting a new one.
- Check whether the sender is blocked in your phone's messaging app.

Data not working after a recharge

Balance and plan benefits are updated within a few minutes of a recharge. Restart the phone and toggle airplane mode. If data still does not work after thirty minutes, contact SkyTel support with the recharge time and reference number.

Contacting support

If the issue continues after these steps, contact SkyTel support at 1800-000-0000. Keep your number, the time the problem started and the steps you tried ready, so the agent can help quickly.
